Question	What are the Pool	Effects of Dobt (ricoc?

Real Effects

- Old View: output loss Eaton Gersovitz
- Less Old View: output loss through banking disruption Gennaioli, Martin and Rossi

ILECTS OF

• this paper: output loss through banking disruption effects on firms

- new new view: wait and see!
- Crises
 - distinguish default from debt crisis: news shock
 - markets: debt or banking or both
 - caused by: fundamentals or beliefs
 - within: a country or a union

Relative to Literature	Facts	Model	Counterfactuals
o●ooo	0000000	0000	
Conceptually, This p	aper		

- $\textcircled{0} \quad \text{debt crisis} \rightarrow$
- $\textcircled{0} \hspace{0.1 cm} \text{price of debt falls} \rightarrow \\$
- $\textbf{③ banks balance sheets deteriorate} \rightarrow$
- ${f 0}$ lending rates increase; constraints tighten ${
 m
 ightarrow}$
- firm's relying on bank credit reduce investment and employment
- **o** output falls, reallocation falls, aggregate TFP falls.

What is the Value Ad	dded of Putting	these Pieces T	ogether

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

- gives more content to the real effects of debt crises
- Ø debt crisis is a particular shock to banks
- Inight ights channel linking banks to firms

Relative to Literature	Facts	Model	Counterfactuals
000●0	0000000	0000	0000
Missing Elements			

- Government
 - Revenues Fall and default probability increases
 - 2 Government chooses to support banks, bond prices fall more

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬる

- EU/ECB Bailout
- corporate default. (Moretti)

- What does a default model with links to banks and firms "look like"?
- What is the evidence linking default risk to bank and firms?
- What are the effects (firm, aggregate) of an increased default risk?

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Relative to Literature	Facts	Model	Counterfactuals

Questions the Paper	Could be Posing	g	

- What does a default model with links to banks and firms "look like"?
- What is the evidence linking default risk to bank and firms?
- What are the effects (firm, aggregate) of an increased default risk?
- Paper touches on all three. FOCUS on last question, building on the first two

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

00000	●000000	0000	0000
Their Evidence			

- comes way too late (p28)
- key points
 - crises in 2010 when spreads rose, ends with OMT in summer 2012

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

- output and TFP fell well before
- TFP rose briefly during crises
- firm spreads rose too

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 - のへで

Relative to Literature	Facts	Model	Counterfactuals
00000	000000●	0000	0000
Greece: Fakos et al			

- investment slump in Greece during crisis
- caused by reduction in credit supply
- firms finance with debt or retained earnings... occasionally binding constraint

- back out considerable credit supply shocks
- partial equilibrium exercise

- islands: is italy really a bunch of islands? Dont the large 5 banks operate throughout?
- no risk aversion of HHs: Usually key in default models
- firms
 - no adjustment costs,no exit
 - matters for whether borrowing constraints ever bind
 - here borrowing constraints on working capital are assumed to bind. evidence of this?
 - what is the marginal source of funds for firms?
 - retained earnings used to relax constraints no?
 - do they really generate (16) as a FOC?
 - Moretti paper has adjustment costs but default hits firm productivity directly

Government	Model Questions	Concerns	
Relative to Literature	Facts	Model	Counterfactuals
00000	0000000	o●oo	0000

- government's state contingent bond choice determines future probability of default and thus spread
- objective function $U_g(G)$
- AR(1) cost of default: should it be public information? Independent of fundamentals? what identifies the serial correlation of the taste shock?
- A falling implies less revenue and so more likely default. back to this point later

Relative to Literature	Facts	Model	Counterfactuals
00000	0000000	oo●o	0000
Quantitative Analysis	Regressions		

• key is (27)

$$\hat{py}_{i,t} = \alpha_i + \hat{\beta} \left(spr_t \times lev_i \times exp_i \right) + \delta' \Gamma_{i,t} + \varepsilon_{i,t},$$

- \bullet lots of effort to explain the regression and to decipher the estimated β
- prefer indirect inference approach that comes later
- other studies point to a nonlinear specification: link to occasionally binding constraints

Relative to Literature	Facts	Model	Counterfactuals
00000	0000000	○○○●	0000
Quantitative Analysis	s: estimation/	calibration	

- Data Points
 - Amadeus
 - balanced vs unbalanced panels: what were exit rates during this period?
 - are these the firms with relationships with small banks as marginal source of credit? broad measure of debt used.
 - geographical dispersion of exposure is interesting but aren't balance sheets integrated?
- Approach
 - prefer use of (27) or similar equation here through indirect inference
 - $\bullet\,$ have estimated some of the same parameters for Italy: markup around 20%
 - estimation of government discount factor: identification? Incorporates turnover?
 - direct effect: 75% of firms have a working capital requirement of 1.27; surely much of the debt is not for working capital!

Counterfactual: Hear	t of the Analysis	S	

What do they do?

- What does a default model with links to banks and firms "look like"?
- What is the evidence linking default risk to bank and firms?
- What are the effects (firm, aggregate) of an increased default risk?
- realized shocks set to match output and spread. But spread impacted by TFP too?

Relative to Literature	Facts	Model	Counterfactuals

Note: From ABB

Counterfactual: Ex	valuation		
Relative to Literature	Facts	Model	Counterfactuals
00000	0000000	0000	00●0

Yes!!

- focus on key moments and parameters driving results
- learn a lot from this part of the estimation exercise: identify the parameters and moments that are key to the question.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

• find substantial output loss

00000	0000000	0000	0000
Counterfactual:	Evaluation		

Yes!!

- focus on key moments and parameters driving results
- learn a lot from this part of the estimation exercise: identify the parameters and moments that are key to the question.
- find substantial output loss

But

- TFP reduction
 - did it fall at the firm level or in aggregate?
 - fall in reallocation due to increased bank frictions?
 - why is there the same decline in TFP without the crisis?? should be interdependent or is crisis independent of fundamentals?
 - not sure this resolves the initial question about causality

- Source of Crises is what?
 - cheap talk of Sarkozy-Merkel
 - TFP reduction
 - default cost
 - other countries??

Relative to Literature	Facts	Model	Counterfactuals
00000	0000000	0000	000●
Suggested Order			

- Motivation
- Data
- Model
- Estimation of Model : use some moments including (27)
- Counterfactuals
- Section 4 with reduced form estimation and interpretation is another paper
